1

- 1. (Currently Amended) An anti-scaling device comprising a hollow central body 1 portion mounted on a bar for rotation around a transverse axis, said bar passing through the 2 hollow central body portion along said transverse axis, and several spike units extending 3 outwardly from the body portion in different directions wherein the spike units are [rotatably] 4 mounted for rotation in use on the central body portion around axes non-congruent with the 5 6 transverse axis.
- 1 2. (Previously Presented) An anti-scaling device according to claim 1, wherein the spike units are detachably mounted on the central body portion. 2
- 3. (Previously Presented) An anti-scaling device according to claim 1, wherein there 1 2 are pairs of spike units disposed in a diametrically opposed relationship relative to the central body portion. 3
  - 4. (Previously Presented) An anti-scaling device according to claim 1, wherein the central body portion has spigots for mounting the spike units.
- An anti-scaling device according to claim 1 further 5. (Previously Presented) comprising serrated webs extending outwardly from the central body portion between the spike 2 units. 3
- 6. (Previously Presented) An anti-scaling device according to claim 5, wherein the 1 serrated webs extend along radial axes displaced 45° from the radial axes of the spike units. 2

- 7. (Previously Presented) An anti-scaling device according to claim 1, wherein rows of sharp-edged teeth are axially aligned along the central body portion.
- 8. (Previously Presented) An anti-scaling device according to claim 1, wherein the
- spike units are in the form of partially rotatable serrated propellers.
- 9. (Previously Presented) An anti-scaling device according to claim 1, wherein the spike units are pivotably mounted.
- 1 10. (Previously Amended) An anti-scaling device according to claim 1, wherein the device is moulded from a plastics material.
